SUBJECT INDEX TO VOLUME 69

Acetylcholine receptors, disulphide ring 8
Acidosis, cardiac tissue, model 527–530
Alcohol dehydrogenase, PQQ-containing 14–15
Arrhythmia, global mechanisms 206–208
Autocatalysis 127–134

Bacteria
  dehydrogenases
    methanol 3–14
    PQQ 1–3
    quinohaemoprotein alcohol 14
Bioenergetics
  cardiac 318–319, 445, 450, 455–456
  modeling 544–545
    chemical kinetic relations 548–549
    control coefficients 549–550
    dynamic mass balances 547–548
    tissue-specific 546–547

Ca^{2+}-induced Ca^{2+}-release (CICR) mechanism 227–229
Ca-ATPase pump, down-regulation model 503, 506–507
Calcium, sensitising drugs, cardiac 320–321
Calcium dynamics, wave propagation 225–236
Cardiac, *see also* Coronary
Cardiac action potential, 3-D electrophysiology 162–163
Cardiac anatomy, fetal, 3-D echocardiography 257–272
Cardiac architecture, mechanical regulation of 563–565
Cardiac cells
  calcium dynamics, computer simulation 225, 236
  electrical activation
    3-D model 205–223
    modeling 163–165
  membrane ion channels 318
  models, Oxsoft[c] HEART 174, 515
  see also Myocytes
Cardiac development
  cardiac tube 238–239, 243–245
  looping 239–240, 245–247
  septation 242, 250–252
  trabeculation 241–242, 247–250
  valve formation 242, 252
Cardiac drugs, calcium sensitising 320–321
Cardiac fibers
  geometry 242, 253
  orientation 212–213
  stress, calculation 276–280
  stress-strain diagrams 273, 275–276
Cardiac function
  mechanics, modeling 161–162, 165–171
  normal 445
  rabbit ventricular anatomy 157–183
  stretch-activated ion channels (SACs) 172–174
Cardiac mapping, 3-D conduction models 205–223
Cardiac metabolism
  bioenergetics 318–319, 445, 450, 455–456
    model 521–527, 546
  calcium 445, 457
  excitation-contraction coupling 450, 457
  gas exchange, model 550–551
  oxidative phosphorylation 453–455
  oxygen consumption 452–453
Cardiac muscle
  dynamic stiffness 312–313
  mechanics
    fading memory model 303–305
    finite duration length steps 307–309
    force-velocity curve 305–307
    models of 289–331
  shortening deactivation 315–316
  tension-velocity relations 310–312
Cardiac myocytes
  troponin C 292–295
    crossbridge kinetics 302–303, 310
    myofilament length dependence 299–302
    thin filament kinetics 296–298, 310
    tropomyosin kinetics 298–299
Cardiac rhythm 154
  see also Arrhythmia
Cardiac tissue
  acidosis, model 527–530
  volume overload hypertrophy 565–570
  wave propagation 225–236
    spiral wave 207, 225, 232–235
  see also Myocardium
Cardiac volume
  fetal
    data acquisition 259–263
    quantitative measurements 263–264
Cardiome Project 154, 445, 448–457, 539–540
CHD *see* Coronary heart disease
CHF *see* Congestive heart failure
Chick heart cell, development 237–255
CICR *see* Ca^{2+}-induced Ca^{2+}-release
Citric acid cycle, evolution 128
Comomonas testosteroni, quinohaemoprotein ethanol dehydrogenase 15
Competitive replication
  fitness 101–105, 114, 144
  at non-linear propagation rates 86–100
Computational physiology 154
Congestive heart failure (CHF), excitation-contraction coupling model 497–514
Conus, specialised conduction 208–209
Coronary, *see also* Cardiac
Coronary artery
  anatomy 450
  occlusion, regional work 273
Coronary flow 445, 451–453
Coronary heart disease (CHD) 515–516
Cytochrome cd_1, propeller structure 5, 6
Cytochrome c_L, methanol dehydrogenase 13–14

Defibrillation
  electrode effects 387–403

line electrodes 395–397
membrane kinetics 391–392
point-source electrodes 397–398
tissue stimulation 391
see also Fibrillation
Defibrillation thresholds (DFTs)
calculation of 359–360
electrode systems 353–355
Can 379–382
lead configurations 353, 360–369
right ventricle 370–373, 373–374
superior vena cava 375–376, 377
finite element analysis 355–358
myocardial volume 359
3DFE *see* Three-dimensional fetal echocardiography
DFTs *see* Defibrillation thresholds
DNA
replication
competitive 85
kinetics 111–113

ECC *see* Excitation-contraction coupling
ECG *see* Electrocardiogram
Electrocardiogram (ECG)
adaptive meshing 415–415
inverse problem 405, 407–409, 419–420
local regularisation methods 405–423, 411–414, 416–419
adaptive methods 409–411
finite element approximation 408–409
Electrostatic forces 484–488
Enzymes, mechanisms, protein machine 66–74
Evolution
autocatalysis 127–134
competition, mimisation of 137–138
complexity 125–127
molecular
coexistence 99–100, 108–111, 117
dual-force model 84–85
force damping 119–123, 143
force equilibrium 108–111, 143
kinetic force 90–93
maximum principle 89–90
path of least kinetic action 93–97
path of least thermodynamic action 97–99, 117
natural selection, species formation 138–142
prebiotic 118
resource capture 134–137
Excitation-contraction coupling 172
heart failure model 497–514
Excitation-contraction coupling (ECC) 450, 457
congestive heart failure 497–514

Fibrillation, mechanism of 225
Fractal lattices
gate 51–56
random walk 47
spectral dimension 48–51

Galactose oxidase 6
Gas exchange, cardiac, model 550–551
Genome Project 446
Glucose dehydrogenase, PQQ-containing 1, 15–18

Hydrodynamic forces 490–492

Ion channels
cardiac cells 318
stretch-activated 172–174
Ischaemia, model 515–538

Left ventricle
deformation
continuum mechanics 339–348
finite element method 340–343
function, modeling 333–351
regional work 273–287
strain
3-D segmentation 337–338
computer vision 338–339
imaging 334–335
magnetic resonance tagging 335–337
phase contrast MRI 338
stress-strain
ischemic 282–284
normoxic 280–282

Metabolic regulation 540–541
measurement 551–552
modeling 541–545
moderate exercise 553–555
respiratory hypoxia 552–553
Methanol dehydrogenase
active site 9–11
ß subunit 7–8
disulphide ring 8–9
mechanism 11–13
superbarrel structure 3–5
tryptophan-docking interactions 5–7
Methylamine dehydrogenase 6
Methylobacterium extorquens 3
Monte Carlo simulations 24
Morphome 446
Myocardium
ATP metabolism, model 521–524
defibrillation, spiral wave re-entry 394–395
electrical currents 451
flow distribution 451–453
glycogen metabolism, model 524
growth regulation 559–572
intracellular calcium 292–295
ischaemia, model 515–538
lactate transport, model 524–526
myofilament activation 319–320
myosin isoforms 320
passive elasticity 291–292, 309
pH regulation, model 517–521
reperfusion, model 515, 531–533
transmembrane potential, shock-induced change 398–400
volume, defibrillation thresholds (DFTs) 359
wall stress 160
wavefronts, rotational anisotropy 207
see also Cardiac tissue
Myocytes
architecture 159–160
calcium handling 499–500
excitation-contraction coupling, heart failure model 497–514

force generation 500–501
glucose delivery systems 452
growth, mechanical regulation of 560–563
hemodynamic loading responses 559–572
mathematical model, calcium dynamics 226–235
receptors 319–320
see also Cardiac cells
Myosin, isoforms 320

Na/Ca exchanger 227
myocardial ischaemia 534
up-regulation model 503–506, 508–511
Natural selection, molecular evolution 138–142
Nitrite reductase, propeller structure 5, 6

Object-oriented programming, molecular dynamics 493–494
Oxidative phosphorylation, cardiac metabolism 453–455

pH
acidosis, cardiac tissue 527–530
cardiac tissue
lactate transport 524–526
measurement 518
metabolism 526–527
intracellular
buffers 519
proton fluxes 519–520
sarcolemmal transporters 519–520, 525
Physiome Project 154, 445–448, 539
PQQ *see* Pyrrolo-quinoline quinone
Prebiotic evolution 118
Protein conformation 25–26
Protein dynamics
fractal lattices 46–56
modelling
longest relaxation time 33–37
reaction rate 37–40
spin glass theory 46–47
vibrations 27–28
Protein folding 28
Protein glass 23, 24, 43–46, 74
Protein machine 23, 24, 56–74
Protein structure
conformational states 31
relaxation time 33–37
tertiary 28
tryptophan-docking interactions 5–7
Proteins
conformational states 25–32
continuum models 483
electrostatic forces 484–488
enzyme reactions, statistical theory 66–74
essential dynamics analysis 493
hydrodynamic forces 490–492
intramolecular dynamics 23–82
molecular dynamics, object-oriented programming 493–494
spin-glass models 46–47
surface forces 489–490
Proteome 447
Pseudomonas aeruginosa, PQQ-containing alcohol dehydrogenases 14
Pyrrolo-quinoline quinone (PQQ) 1–3

Quinohaemoprotein alcohol dehydrogenase 14
Quinohaemoprotein ethanol dehydrogenase 15
Quinoprotein dehydrogenases 1–21

Rabbits, ventricular anatomy 165–171
Reaction mechanisms
fluctuating barrier 25, 40–43
gating 25, 43
Reaction rates
intramolecular dynamics 2, 3, 43
stochastic modeling 33–43
Replication
competitive
fitness 101–105, 114, 144
at non-linear propagation rates 86–100
driving forces 105–108
RNA
driven strand separation 123–124
evolution 133–134
replication
competitive 75
de novo synthesis 116
driving forces 105–108
force damping response 119–123

SACs *see* Stretch-activated ion channels
Sarcolemmal transporters, intracellular pH 519–520, 525
Species formation, molecular evolution 138–142
Stretch-activated ion channels (SACs) 172–174
Surface forces 489–490

Three-dimensional fetal echocardiography (3DFE) 257–272
TnC *see* Troponin C
Troponin C (TnC) 290, 319
binding kinetics 295–296
binding sites 292–295
contraction, effect of intracellular pH 520–521

Ventricle
geometry 158, 170
myofiber architecture 159–160
pace-mapping 209–211
experimental data 211–220
structure, model 165–172
wall stress 160
see also Left ventricle
Ventricular fibrillation *see* Fibrillation

Water
electrostatic forces 484–488
hydrodynamic forces 490–492
surface forces 489–490
